Liebert Overview

Liebert helps organizations achieve new levels of network and data availability through a platform of adaptive power, cooling and monitoring technologies that protect mission-critical systems from the network closet to the data center. Liebert has more than one-million installations worldwide, including all 500 of the 2004 Fortune 500.

Liebert power technologies feature fault-tolerant, high-availability UPS and related systems for rooms, racks and desktops, including data-center-quality UPS systems that fit in just 2U of rack space. Liebert has been the leader in cooling technologies for four decades, and its systems are designed to manage the heat from the new generation of extreme-density systems, whether those systems are installed in a large data center or a small closet. Monitoring technologies provide network- or Web-based visibility and management of the support infrastructure.

Liebert maintains a national network of technical experts to assess customer needs and recommend appropriate solutions, and has the largest service operation in the industry. Liebert is backed by the development and technology resources of Emerson Network Power, the global leader in enabling business-critical continuity.

Specialist Area:
IP Communications

Sectors:
All

Sphere of influence:
Worldwide
